Inference in First-Order Logic

- Proofs – extend propositional logic inference to deal with quantifiers
- Unification
- Generalized modus ponens
- Forward and backward chaining – inference rules and reasoning program
- Completeness – Gödel's theorem: for FOL, any sentence entailed by another set of sentences can be proved from that set
- Resolution – inference procedure that is complete for any set of sentences
- Logic programming

Add WeChat powcoder

Logic as a representation of the World

Desirable Properties of Inference Procedures

Remember: propositional logic

- ◇ **Modus Ponens or Implication-Elimination:** (From an implication and the premise of the implication, you can infer the conclusion.)

$$\frac{\alpha \Rightarrow \beta, \quad \alpha}{\beta}$$

- ◇ **And-Elimination:** (From a conjunction, you can infer any of the conjuncts.)

$$\frac{\alpha_1 \wedge \alpha_2 \wedge \dots \wedge \alpha_n}{\alpha_i}$$

- ◇ **And-Introduction:** (From a list of sentences, you can infer their conjunction.)

$$\frac{\alpha_1, \alpha_2, \dots, \alpha_n}{\alpha_1 \wedge \alpha_2 \wedge \dots \wedge \alpha_n}$$

- ◇ **Or-Introduction:** (From a sentence, you can infer its disjunction with anything else at all.)

$$\frac{\alpha_i}{\alpha_1 \vee \alpha_2 \vee \dots \vee \alpha_n}$$

- ◇ **Double-Negation Elimination:** (From a doubly negated sentence, you can infer a positive sentence.)

$$\frac{\neg \neg \alpha}{\alpha}$$

- ◇ **Unit Resolution:** (From a disjunction, if one of the disjuncts is false, then you can infer the other one is true.)

$$\frac{\alpha \vee \beta, \quad \neg \beta}{\alpha}$$

- ◇ **Resolution:** (This is the most difficult. Because β cannot be both true and false, one of the other disjuncts must be true in one of the premises. Or equivalently, implication is transitive.)

$$\frac{\alpha \vee \beta, \quad \neg \beta \vee \gamma}{\alpha \vee \gamma}$$

or equivalently

$$\frac{\neg \alpha \Rightarrow \beta, \quad \beta \Rightarrow \gamma}{\neg \alpha \Rightarrow \gamma}$$

Reminder

- Ground term: A term that does not contain a variable.
 - A constant symbol
 - A function applies to some ground term

Assignment Project Exam Help

<https://powcoder.com>

- $\{x/a\}$: substitution/binding list

Add WeChat powcoder

Proofs

Sound inference: find α such that $KB \models \alpha$.

Proof process is a search, operators are inference rules.

E.g., Modus Ponens (MP)

$$\frac{\alpha, \quad \alpha \Rightarrow \beta}{\beta} \quad \frac{At(Joe, UCB) \quad At(Joe, UCB) \Rightarrow OK(Joe)}{OK(Joe)}$$

E.g., And-Introduction (AI)

$$\frac{\alpha \quad \beta}{\alpha \wedge \beta} \quad \frac{OK(Joe) \quad CSMajor(Joe)}{OK(Joe) \wedge CSMajor(Joe)}$$

E.g., Universal Elimination (UE)

$$\frac{\forall x \quad \alpha}{\alpha\{x/\tau\}} \quad \frac{\forall x \quad At(x, UCB) \Rightarrow OK(x)}{At(Pat, UCB) \Rightarrow OK(Pat)}$$

τ must be a ground term (i.e., no variables)

Proofs

The three new inference rules for FOL (compared to propositional logic) are:

- **Universal Elimination (UE):**

for any sentence α , variable x and ground term τ ,

$$\frac{\forall x \quad \alpha}{\alpha\{x/\tau\}}$$

- **Existential Elimination (EE):**

for any sentence α , variable x and constant symbol k not in KB,

$$\frac{\exists x \quad \alpha}{\alpha\{x/k\}}$$

- **Existential Introduction (EI):**

for any sentence α , variable x not in α and ground term g in α ,

$$\frac{\square}{\exists x \quad \alpha\{g/x\}}$$

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Proofs

The three new inference rules for FOL (compared to propositional logic) are:

- **Universal Elimination (UE):**

for any sentence α , variable x and ground term τ ,

$$\frac{\forall x \alpha}{\alpha\{x/\tau\}}$$

e.g., from $\forall x \text{ Likes}(x, \text{Candy})$ and $\{x/\text{Joe}\}$ we can infer $\text{Likes}(\text{Joe}, \text{Candy})$

- **Existential Elimination (EE):**

for any sentence α , variable x and constant symbol k not in KB,

$$\frac{\exists x \alpha}{\alpha\{x/k\}}$$

symbol

e.g., from $\exists x \text{ Kill}(x, \text{Victim})$ we can infer $\text{Kill}(\text{Murderer}, \text{Victim})$, if Murderer new

- **Existential Introduction (EI):**

for any sentence α , variable x not in α and ground term g in α ,

$$\frac{\alpha}{\exists x \alpha\{g/x\}}$$

e.g., from $\text{Likes}(\text{Joe}, \text{Candy})$ we can infer $\exists x \text{ Likes}(x, \text{Candy})$

Example Proof

Bob is a buffalo

Pat is a pig

Buffaloes outrun pigs

Bob outruns Pat

1. $Buffalo(Bob)$

2. $Pig(Pat)$

3. $\forall x, y \text{ } Buffalo(x) \wedge Pig(y) \equiv Faster(x, y)$

Assignment Project Exam Help

Assignment Project Exam Help

UE 3, $\{x/Bob, y/Pat\} \models Buffalo(Bob) \wedge Pig(Pat) \Rightarrow Faster(Bob, Pat)$

Add WeChat powcoder

Example Proof

Assignment Project Exam Help

MP 6 & 7

<https://powcoder.com>

6. *Faster(Bob, Pat)*

Add WeChat powcoder

Search with primitive example rules

Operators are inference rules

States are sets of sentences

Goal test checks state to see if it contains query sentence

<https://powcoder.com>

AI, UE, MP is a common inference pattern

Add WeChat powcoder

Problem: branching factor huge, esp. for UE

Idea: find a substitution that makes the rule
premise match some known facts

⇒ a single, more powerful inference rule

Unification

A substitution σ unifies atomic sentences p and q if $p\sigma = q\sigma$

p	q
$Knows(John, x)$	$Knows(John, Jane)$
$Knows(John, x)$	$Knows(y, OJ)$
$Knows(John, x)$	$Knows(y, Mother(y))$

Add WeChat powcoder

Goal of unification: finding σ

Unification

Assignment Project Exam Help

<https://powcoder.com>

$\{x/Jane\}$

$\{x/John, y/OJ\}$

$\{y/John, x/Mother(John)\}$

Idea: Unify rule premises with known facts, apply unifier to conclusion

E.g., if we know q and $Knows(John, x) \Rightarrow Likes(John, x)$

then we conclude $Likes(John, Jane)$

$Likes(John, OJ)$

$Likes(John, Mother(John))$

Extra example for unification

Assignment Project Exam Help

P	Q	σ
Student(x)	Student(Bob)	$\{x/\text{Bob}\}$
Sells(Bob, x)	Sells(x, coke)	$\{x/\text{coke}, x/\text{Bob}\}$
		Is it correct?

Extra example for unification

Assignment Project Exam Help

P	Q	σ
Student(x)	Student(Bob)	$\{x/\text{Bob}\}$
Sells(Bob, x)	Sells(y, coke)	$\{x/\text{coke}, y/\text{Bob}\}$

More Unification Examples

- VARIABLE term
- Assignment Project Exam Help**
- 1 – unify($P(a,X)$, $P(a,b)$) $\sigma = \{X/b\}$
- 2 – unify($P(a,X)$, $P(Y,b)$) $\sigma = \{Y/a, X/b\}$
- 3 – unify($P(a,X)$, $P(Y,f(a))$) $\sigma = \{Y/a, X/f(a)\}$
- 4 – unify($P(a,X)$, $P(X,b)$) $\sigma = \text{failure}$
- https://powcoder.com**
- Add WeChat powcoder**

Note: If $P(a,X)$ and $P(X,b)$ are independent, then we can replace X with Y and get the unification to work.

Generalized Modus Ponens (GMP)

$$\frac{p_1', p_2', \dots, p_n', (p_1 \wedge p_2 \wedge \dots \wedge p_n \Rightarrow q)}{q} \quad \text{where } p_i' \sigma = p_i \sigma \text{ for all } i$$

Assignment Project Exam Help

E.g. $p_1' = \text{Faster}(\text{Bob}, \text{Pat})$

$p_2' = \text{Faster}(\text{Pat}, \text{Steve})$

$p_1 \wedge p_2 \Rightarrow q = \text{Faster}(x, y) \wedge \text{Faster}(y, z) \Rightarrow \text{Faster}(x, z)$

$\sigma = \{x/\text{Bob}, y/\text{Pat}, z/\text{Steve}\}$

$q\sigma = \text{Faster}(\text{Bob}, \text{Steve})$

<https://powcoder.com>

Add WeChat powcoder

GMP used with KB of definite clauses (*exactly* one positive literal):

either a single atomic sentence or

(conjunction of atomic sentences) \Rightarrow (atomic sentence)

All variables assumed universally quantified

Soundness of GMP

Need to show that

$$p_1', \dots, p_n' \models (p_1 \wedge \dots \wedge p_n \Rightarrow q) \models q\sigma$$

provided that $p_i'\sigma = p_i\sigma$ for all i

Lemma: For any definite clause p , we have $p \models p\sigma$ by UE

1. $(p_1 \wedge \dots \wedge p_n \Rightarrow q) \models (p_1\sigma \wedge \dots \wedge p_n\sigma \Rightarrow q\sigma)$
2. $p_1', \dots, p_n' \models p_1' \wedge \dots \wedge p_n' \models p_1'\sigma \wedge \dots \wedge p_n'\sigma$
3. From 1 and 2, $q\sigma$ follows by simple MP

Properties of GMP

- Why is GMP an efficient inference rule?

Assignment Project Exam Help

- It takes **bigger steps**, combining several small inferences into one

- It takes **sensible steps**: uses **https://powcoder.com** eliminations that are guaranteed to help (rather than random UEs)

- It uses a precompilation step which converts the KB to **canonical form** (Horn sentences)

Add WeChat powcoder

Remember: sentence in Horn form is a conjunction of Horn clauses (clauses with at most one positive literal), e.g.,
 $(A \vee \neg B) \wedge (B \vee \neg C \vee \neg D)$, that is $(B \Rightarrow A) \wedge ((C \wedge D) \Rightarrow B)$

Horn form

- We convert sentences to Horn form as they are entered into the KB
- Using Existential Elimination and And Elimination

- e.g., $\exists x \text{ Owns}(\text{Nono}, x) \wedge \text{Missile}(x)$ becomes

$\text{Owns}(\text{Nono}, M)$
 $\text{Missile}(M)$

<https://powcoder.com>

(with M a new symbol that was not already in the KB)

Add WeChat powcoder

Forward chaining

When a new fact p is added to the KB
for each rule such that p unifies with a premise
if the other premises are known
then add the conclusion to the KB and continue chaining

Forward chaining is data-driven
e.g., inferring properties and categories from percepts

Forward chaining example

Add facts 1, 2, 3, 4, 5, 7 in turn.

Number in \square = unification literal; \checkmark indicates rule firing

- Assignment Project Exam Help**
<https://powcoder.com>
Add WeChat powcoder
1. $Buffalo(x) \wedge Pig(y) \Rightarrow Faster(x, y)$
 2. $Pig(y) \wedge Slug(z) \Rightarrow Faster(y, z)$
 3. $Faster(x, y) \wedge Faster(y, z) \Rightarrow Faster(x, z)$
 4. $Buffalo(Bob) \quad \square_{1a, \times}$
 5. $Pig(Pat) \quad \square_{1b, \checkmark} \rightarrow \underline{\square_{2a, \times}} \quad \square_{3a, \times}, \square_{3b, \times}$
 7. $Slug(Steve) \quad \square_{2b, \checkmark}$
 $\rightarrow \underline{\square_{3a, \times}}, \underline{\square_{3b, \checkmark}}$
 $\rightarrow \underline{\square_{3a, \times}}, \underline{\square_{3b, \times}}$

Backward chaining

When a query q is asked

if a matching fact q' is known, return the unifier

for each rule whose consequent q' matches q

attempt to prove each premise of the rule by backward chaining

(Some added complications in keeping track of the unifiers)

(More complications help to avoid infinite loops)

Two versions: find any solution, find all solutions

Backward chaining is the basis for logic programming, e.g., Prolog

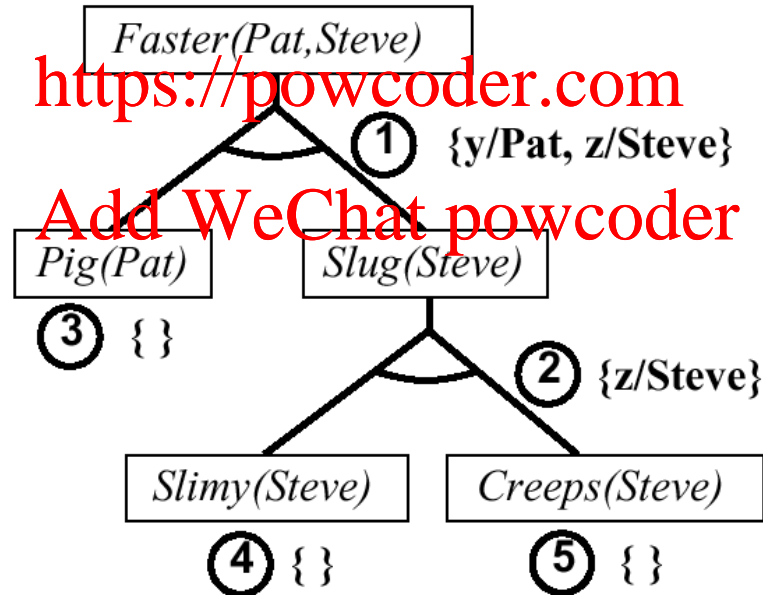

Backward chaining example

1. $Pig(y) \wedge Slug(z) \Rightarrow Faster(y, z)$
2. $Slimy(z) \wedge Creeps(z) \Rightarrow Slug(z)$
3. $Pig(Pat)$
4. $Slimy(Steve)$
5. $Creeps(Steve)$

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Another Example (from Konelsky)

- Nintendo example.
 - Nintendo says it is Criminal for a programmer to provide emulators to people. My friends don't have a Nintendo 64, but they use software that runs N64 games on their PC, which is written by Reality Man, who is a programmer.

<https://powcoder.com>

Add WeChat powcoder

Forward Chaining

- The knowledge base initially contains:
 - $\text{Programmer}(x) \wedge \text{Emulator}(y) \wedge \text{People}(z) \wedge \text{Provide}(x, z, y) \Rightarrow \text{Criminal}(x)$
 - $\text{Use}(\text{friends}, x) \wedge \text{Runs}(x, \text{N64 games}) \Rightarrow \text{Provide}(\text{Reality Man}, \text{friends}, x)$
 - $\text{Software}(x) \wedge \text{Runs}(x, \text{N64 games}) \Rightarrow \text{Emulator}(x)$

Forward Chaining

$\text{Programmer}(x) \wedge \text{Emulator}(y) \wedge \text{People}(z) \wedge \text{Provide}(x,z,y) \Rightarrow \text{Criminal}(x)$ (1)

$\text{Use}(\text{friends}, x) \wedge \text{Runs}(x, \text{N64 games}) \Rightarrow \text{Provide}(\text{Reality Man}, \text{friends}, x)$ (2)

$\text{Software}(x) \wedge \text{Runs}(x, \text{N64 games}) \Rightarrow \text{Emulator}(x)$ (3)

<https://powcoder.com>

- Now we add atomic sentences to the KB sequentially, and call on the forward-chaining procedure:

Add WeChat powcoder

- FORWARD-CHAIN(KB, Programmer(Reality Man))

Forward Chaining

Programmer(x) \wedge Emulator(y) \wedge People(z) \wedge Provide(x,z,y) \Rightarrow Criminal(x) (1)

Use(friends, x) \wedge Runs(x, N64 games) \Rightarrow Provide(Reality Man, friends, x) (2)

Software(x) \wedge Runs(x, N64 games) \Rightarrow Emulator(x) (3)

Programmer(Reality Man)
(4)

Assignment Project Exam Help

<https://powcoder.com>

- This new premise unifies with (1) with **subst**({x/Reality Man}, Programmer(x)) but not all the premises of (1) are yet known, so nothing further happens.

Add WeChat powcoder

Forward Chaining

Programmer(x) \wedge Emulator(y) \wedge People(z) \wedge Provide(x,z,y) \Rightarrow Criminal(x) (1)

Use(friends, x) \wedge Runs(x, N64 games) \Rightarrow Provide(Reality Man, friends, x) (2)

Software(x) \wedge Runs(x, N64 games) \Rightarrow Emulator(x)
(3)

Programmer(Reality Man) (4)

- Continue adding atomic sentences:
 - FORWARD-CHAIN(KB, People(friends))

Forward Chaining

Programmer(x) \wedge Emulator(y) \wedge People(z) \wedge Provide(x,z,y) \Rightarrow Criminal(x)
(1)

Use(friends, x) \wedge Runs(x, N64 games) \Rightarrow Provide(Reality Man, friends, x) (2)

Software(x) \wedge Runs(x, N64 games) \Rightarrow Emulator(x)
(3)

Programmer(Reality Man)

People(friends)

<https://powcoder.com>

(4)

Add WeChat powcoder

(5)

- This also unifies with (1) with **subst**({z/friends}, People(z)) but other premises are still missing.

Forward Chaining

Programmer(x) \wedge Emulator(y) \wedge People(z) \wedge Provide(x,z,y) \Rightarrow Criminal(x)
(1)

Use(friends, x) \wedge Runs(x, N64 games) \Rightarrow Provide(Reality Man, friends, x) (2)

Software(x) \wedge Runs(x, N64 games) \Rightarrow Emulator(x)
(3)

Programmer(Reality Man) <https://powcoder.com> (4)

People(friends) (5)

Add WeChat powcoder

- Add:
 - FORWARD-CHAIN(KB, Software(U64))

Forward Chaining

Programmer(x) \wedge Emulator(y) \wedge People(z) \wedge Provide(x,z,y) \Rightarrow Criminal(x) (1)

Use(friends, x) \wedge Runs(x, N64 games) \Rightarrow Provide(Reality Man, friends, x) (2)

Software(x) \wedge Runs(x, N64 games) \Rightarrow Emulator(x) (3)

Programmer(Reality Man) (4)

People(friends) (5)

Software(U64) <https://powcoder.com> (6)

Add WeChat powcoder

- This new premise unifies with (3) but the other premise is not yet known.

Forward Chaining

Programmer(x) \wedge Emulator(y) \wedge People(z) \wedge Provide(x,z,y) \Rightarrow Criminal(x) (1)

Use(friends, x) \wedge Runs(x, N64 games) \Rightarrow Provide(Reality Man, friends, x) (2)

Software(x) \wedge Runs(x, N64 games) \Rightarrow Emulator(x) (3)

Programmer(Reality Man) (4)

People(friends) (5)

Software(U64) <https://powcoder.com> (6)

Add WeChat powcoder

- Add:
 - FORWARD-CHAIN(KB, Use(friends, U64))

Forward Chaining

Programmer(x) \wedge Emulator(y) \wedge People(z) \wedge Provide(x,z,y) \Rightarrow Criminal(x) (1)

Use(friends, x) \wedge Runs(x, N64 games) \Rightarrow Provide(Reality Man, friends, x) (2)

Software(x) \wedge Runs(x, N64 games) \Rightarrow Emulator(x) (3)

Programmer(Reality Man) (4)

People(friends) (5)

Software(U64) <https://powcoder.com> (6)

Use(friends, U64) (7)

Add WeChat powcoder

- This premise unifies with (2) but one still lacks.

Forward Chaining

Programmer(x) \wedge Emulator(y) \wedge People(z) \wedge Provide(x,z,y) \Rightarrow Criminal(x) (1)

Use(friends, x) \wedge Runs(x, N64 games) \Rightarrow Provide(Reality Man, friends, x) (2)

Software(x) \wedge Runs(x, N64 games) \Rightarrow Emulator(x) (3)

- Addition of these new facts triggers further forward chaining.

Forward Chaining

Programmer(x) \wedge Emulator(y) \wedge People(z) \wedge Provide(x,z,y) \Rightarrow Criminal(x) (1)

Use(friends, x) \wedge Runs(x, N64 games) \Rightarrow **Provide(Reality Man, friends, x)** (2)

Software(x) \wedge Runs(x, N64 games) \Rightarrow **Emulator(x)** (3)

Programmer(Reality Man) **Assignment Project Exam Help** (4)

People(friends) (5)

Software(U64) **<https://powcoder.com>** (6)

Use(friends, U64) (7)

Runs(U64, N64 games) **Add WeChat powcoder** (8)

Provide(Reality Man, friends, U64) (9)

Emulator(U64) (10)

Criminal(Reality Man) (11)

- Which results in the final conclusion: Criminal(Reality Man)

Forward Chaining

- Forward Chaining acts like a breadth-first search at the top level, with depth-first sub-searches.
- Since the search space spans the entire KB, a large KB must be organized in an intelligent manner in order to enable efficient searches in reasonable time.

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Backward Chaining

- The algorithm (available in detail in textbook):
 - a knowledge base KB
 - a desired conclusion c or question q
 - finds all sentences that are answers to q in KB or prove c
 - if q is directly provable by premises in KB, infer q and remember how q was inferred (building a list of answers).
 - find all implications that have q as a consequent.
 - for each of these implications, find out whether all of its premises are now in the KB, in which case infer the consequent and add it to the KB, remembering how it was inferred. If necessary, attempt to prove the implication also via backward chaining
 - premises that are conjuncts are processed one conjunct at a time

Backward Chaining

- Question: Has Reality Man done anything criminal?

- $\text{Criminal}(\text{Reality Man})$

Assignment Project Exam Help

- Possible answers: <https://powcoder.com>

- $\text{Steal}(x, y) \Rightarrow \text{Criminal}(x)$
 - $\text{Kill}(x, y) \Rightarrow \text{Criminal}(x)$
 - $\text{Grow}(x, y) \wedge \text{Illegal}(y) \Rightarrow \text{Criminal}(x)$
 - $\text{HaveSillyName}(x) \Rightarrow \text{Criminal}(x)$
 - $\text{Programmer}(x) \wedge \text{Emulator}(y) \wedge \text{People}(z) \wedge \text{Provide}(x, z, y) \Rightarrow \text{Criminal}(x)$

Backward Chaining

- Question: Has Reality Man done anything criminal?

Backward Chaining

- Question: Has Reality Man done anything criminal?

Backward Chaining

- Question: Has Reality Man done anything criminal?

Backward Chaining

- Backward Chaining benefits from the fact that it is directed toward proving one statement or answering one question.
- In a focused, specific knowledge base, this greatly decreases the amount of superfluous work that needs to be done in searches.
- However, in broad knowledge bases with extensive information and numerous implications, many search paths may be irrelevant to the desired conclusion.
- Unlike forward chaining, where all possible inferences are made, a strictly backward chaining system makes inferences only when called upon to answer a query.

Field Trip – Russell's Paradox (Bertrand Russell, 1901)

- Your life has been simple up to this point, let's see how logical negation and self-referencing can totally ruin our day.
- Russell's paradox is the most famous of the logical or set-theoretical paradoxes. The paradox arises within naive set theory by considering the set of all sets that are not members of themselves. Such a set appears to be a member of itself if and only if it is not a member of itself, hence the paradox.
- Negation and self-reference naturally lead to paradoxes, but are necessary for FOL to be universal.
- Published in *Principles of Mathematics* (1903).

Field Trip – Russell's Paradox

- **Basic example:**

- Librarians are asked to make catalogs of all the books in their libraries.
- Some librarians consider the catalog to be a book in the library and list the catalog in itself.
- The library of congress is asked to make a master catalog of all library catalogs which do **not** include themselves.
- Should the master catalog in the library of congress include **itself**?
- Keep this tucked in you brain as we talk about logic today. Logical systems can easily tie themselves in knots.
- See also: <http://plato.stanford.edu/entries/russell-paradox/>
- For additional fun on paradoxes check out "I of Newton" from: *The New Twilight Zone* (1985)
http://en.wikipedia.org/wiki/I_of_Newton

Completeness

- As explained earlier, Generalized Modus Ponens requires sentences to be in Horn form:
 - atomic, or
 - an implication with a conjunction of atomic sentences as the antecedent and an atom as the consequent.
- However, some sentences cannot be expressed in Horn form.
 - e.g.: $\forall x \neg \text{bored_of_this_lecture}(x)$ (not a definite Horn clause)
 - Cannot be expressed as a definite Horn clause (exactly 1 positive literal) due to presence of negation.

Completeness

- A significant problem since Modus Ponens cannot operate on such a sentence, and thus cannot use it in inference.
- Knowledge exists but cannot be used.
- Thus inference using Modus Ponens is **incomplete**.

Add WeChat powcoder

Completeness

- However, Kurt Gödel in 1930-31 developed the **completeness theorem**, which shows that it is possible to find **complete** inference rules.

Assignment Project Exam Help

- The theorem states:
 - any sentence entailed by a set of sentences can be proven from that set.

<https://powcoder.com>

=> **Resolution Algorithm** which is a complete inference method.

Completeness

- The completeness theorem says that a sentence can be proved *if* it is entailed by another set of sentences.
- This is a big deal, since arbitrarily deeply nested functions combined with universal quantification make a potentially infinite search space.
- But entailment in first-order logic is only **semi-decidable**, meaning that if a sentence is *not entailed* by another set of sentences, it cannot necessarily be proven.
 - This is to a certain degree an *exotic* situation, but a *very real* one - for instance the *Halting Problem*.
 - Much of the time, in the real world, you can decide if a sentence is not entailed if by no other means than exhaustive elimination.

Completeness in FOL

Procedure i is complete if and only if

$KB \vdash_i \alpha$ whenever $KB \models \alpha$

Forward and backward chaining are complete for Horn KBs
but incomplete for general first-order logic

E.g., from

$PhD(x) \Rightarrow HighlyQualified(x)$

$\neg PhD(x) \Rightarrow EarlyEarnings(x)$

$HighlyQualified(x) \Rightarrow Rich(x)$

$EarlyEarnings(x) \Rightarrow Rich(x)$

should be able to infer $Rich(Me)$, but FC/BC won't do it

Does a complete algorithm exist?

Historical note

450B.C.	Stoics	propositional logic, inference (maybe)
322B.C.	Aristotle	“syllogisms” (inference rules), quantifiers
1555	Cardano	probability theory (propositional logic + uncertainty)
1847	Boole	propositional logic (again)
1879	Frege	first-order logic
1922	Wittgenstein	proof by truth tables
1930	Gödel	\exists complete algorithm for FOL
1930	Herbrand	complete algorithm for FOL (reduce to propositional)
1931	Gödel	\exists complete algorithm for arithmetic
1960	Davis/Putnam	“practical” algorithm for propositional logic
1965	Robinson	“practical” algorithm for FOL—resolution

Kinship Example

KB:

(1) father (art, jon)

(2) father (bob, kim)

(3) father (X, Y) \Rightarrow parent (X, Y)

Goal: parent (art, jon)?

Refutation Proof/Graph

$\neg \text{parent}(\text{art}, \text{jon}) \quad \text{father}(X, Y) \Rightarrow \text{parent}(X, Y)$
 \ /
 $\neg \text{father}(\text{art}, \text{jon}) \quad \text{father}(\text{art}, \text{jon})$
 \ /
Add WeChat powcoder

Resolution

Entailment in first-order logic is only semidecidable:

can find a proof of α if $KB \models \alpha$

cannot always prove that $KB \not\models \alpha$

Cf. Halting Problem: proof procedure may be about to terminate with success or failure, or may go on for ever

Resolution is a refutation procedure:

to prove $KB \models \alpha$, show that $KB \wedge \neg\alpha$ is unsatisfiable

Resolution uses $KB, \neg\alpha$ in CNF (conjunction of clauses)

Resolution inference rule combines two clauses to make a new one:

Inference continues until an empty clause is derived (contradiction)

Resolution inference rule

Basic propositional version:

$$\frac{\alpha \vee \beta, \neg\beta \vee \gamma}{\alpha \vee \gamma} \quad \text{or equivalently} \quad \frac{\neg\alpha \Rightarrow \beta, \beta \Rightarrow \gamma}{\neg\alpha \Rightarrow \gamma}$$

Full first-order version:

$$\frac{\begin{array}{c} p_1 \vee \dots \vee p_j \vee \dots \vee p_m, \\ \neg q_1 \vee \dots \vee \neg q_k \vee \dots \vee \neg q_n \end{array}}{(p_1 \vee \dots \vee p_{j-1} \vee p_{j+1} \vee \dots \vee p_m \vee q_1 \vee \dots \vee q_{k-1} \vee q_{k+1} \vee \dots \vee q_n)\sigma}$$

where $p_j\sigma = \neg q_k\sigma$

For example,

$$\frac{\begin{array}{c} \neg Rich(x) \vee Unhappy(x) \\ Rich(Me) \end{array}}{Unhappy(Me)}$$

with $\sigma = \{x/Me\}$

Remember: normal forms

Other approaches to inference use syntactic operations on sentences, often expressed in standardized forms

Conjunctive Normal Form (CNF—universal)
conjunction of disjunctions of literals
clauses

“product of sums of simple variables or negated simple variables”

E.g., $(A \vee \neg B) \wedge (B \vee \neg C \vee \neg D)$

Disjunctive Normal Form (DNF—universal)
disjunction of conjunctions of literals
terms

“sum of products of simple variables or negated simple variables”

E.g., $(A \wedge B) \vee (A \wedge \neg C) \vee (A \wedge \neg D) \vee (\neg B \wedge \neg C) \vee (\neg B \wedge \neg D)$

Horn Form (restricted)

conjunction of Horn clauses (clauses with ≤ 1 positive literal)

E.g., $(A \vee \neg B) \wedge (B \vee \neg C \vee \neg D)$

Often written as set of implications:

$B \Rightarrow A$ and $(C \wedge D) \Rightarrow B$

Conjunctive normal form - (how-to is coming up...)

Literal = (possibly negated) atomic sentence, e.g., $\neg Rich(Me)$

Clause = disjunction of literals, e.g., $\neg Rich(Me) \vee Unhappy(Me)$

The KB is a conjunction of clauses

Any FOL KB can be converted to CNF as follows:

1. Replace $P \Rightarrow Q$ by $\neg P \vee Q$
2. Move \neg inwards, e.g., $\neg \forall x P$ becomes $\forall x \neg P$
3. Standardize variables apart, e.g., $\forall x P \vee \exists x Q$ becomes $\forall x P \vee \exists y Q$
4. Move quantifiers left in order, e.g., $\forall x P \vee \exists x Q$ becomes $\forall x \exists y P \vee Q$
5. Eliminate \exists by Skolemization (next slide)
6. Drop universal quantifiers
7. Distribute \wedge over \vee , e.g., $(P \wedge Q) \vee R$ becomes $(P \vee Q) \wedge (P \vee R)$

Skolemization

$\exists x \text{ Rich}(x)$ becomes $\text{Rich}(G1)$ where $G1$ is a new “Skolem constant”

$\exists k \frac{d}{dy}(k^y) = k^y$ becomes $\frac{d}{dy}(e^y) = e^y$

More tricky when \exists is inside \forall

E.g., “Everyone has a heart”

$\forall x \text{ Person}(x) \Rightarrow \exists y \text{ Heart}(y) \wedge \text{Has}(x, y)$

Incorrect:

$\forall x \text{ Person}(x) \Rightarrow \text{Heart}(H1) \wedge \text{Has}(x, H1)$

Correct:

$\forall x \text{ Person}(x) \Rightarrow \text{Heart}(H(x)) \wedge \text{Has}(x, H(x))$

where H is a new symbol (“Skolem function”)

Skolem function arguments: all enclosing universally quantified variables

in infer that y
its existence is
thus y is a
 $\forall(x)$.

Examples: Converting FOL sentences to clause form...

Convert the sentence

1. $(\forall x)(P(x) \Rightarrow ((\forall y)(P(y) \Rightarrow P(f(x,y))) \wedge \neg(\forall y)(Q(x,y) \Rightarrow P(y))))$
(like $A \Rightarrow (B \wedge \neg C)$)

2. Eliminate \Rightarrow
 $(\forall x)(\neg P(x) \vee ((\forall y)(\neg P(y) \vee P(f(x,y))) \wedge \neg(\forall y)(\neg Q(x,y) \vee P(y))))$

3. Reduce scope of negation
 $(\forall x)(\neg P(x) \vee ((\forall y)(\neg P(y) \vee P(f(x,y))) \wedge (\exists y)(Q(x,y) \wedge \neg P(y))))$

4. Standardize variables
 $(\forall x)(\neg P(x) \vee ((\forall y)(\neg P(y) \vee P(f(x,y))) \wedge (\exists z)(Q(x,z) \wedge \neg P(z))))$

Examples: Converting FOL sentences to clause form...

$$(\forall x)(\neg P(x) \vee ((\forall y)(\neg P(y) \vee P(f(x,y))) \wedge (\exists z)(Q(x,z) \wedge \neg P(z)))) \dots$$

5. Eliminate existential quantification

$$(\forall x)(\neg P(x) \vee ((\forall y)(\neg P(y) \vee P(f(x,y))) \wedge (Q(x,g(x)) \wedge \neg P(g(x)))))$$

6. Drop universal quantification symbols

$$(\neg P(x) \vee ((\neg P(y) \vee P(f(x,y))) \wedge (Q(x,g(x)) \wedge \neg P(g(x)))))$$

7. Convert to conjunction of disjunctions

$$(\neg P(x) \vee \neg P(y) \vee P(f(x,y))) \wedge (\neg P(x) \vee Q(x,g(x))) \wedge (\neg P(x) \vee \neg P(g(x)))$$

Examples: Converting FOL sentences to clause form...

$$(\neg P(x) \vee \neg P(y) \vee P(f(x,y))) \wedge (\neg P(x) \vee Q(x,g(x))) \wedge (\neg P(x) \vee \neg P(g(x))) \dots$$

8. Create separate clauses

$$\neg P(x) \vee \neg P(y) \vee P(f(x,y))$$

$$\neg P(x) \vee Q(x,g(x))$$

$$\neg P(x) \vee \neg P(g(x))$$

9. Standardize variables

$$\neg P(x) \vee \neg P(y) \vee P(f(x,y))$$

$$\neg P(z) \vee Q(z,g(z))$$

$$\neg P(w) \vee \neg P(g(w))$$

Getting back to Resolution proofs ...

To prove α :

- negate it
- convert to CNF
- add to CNF KB
- infer contradiction

E.g., to prove $Rich(me)$, add $\neg Rich(me)$ to the CNF KB

$\neg PhD(x) \vee HighlyQualified(x)$

$PhD(x) \vee EarlyEarnings(x)$

$\neg HighlyQualified(x) \vee Rich(x)$

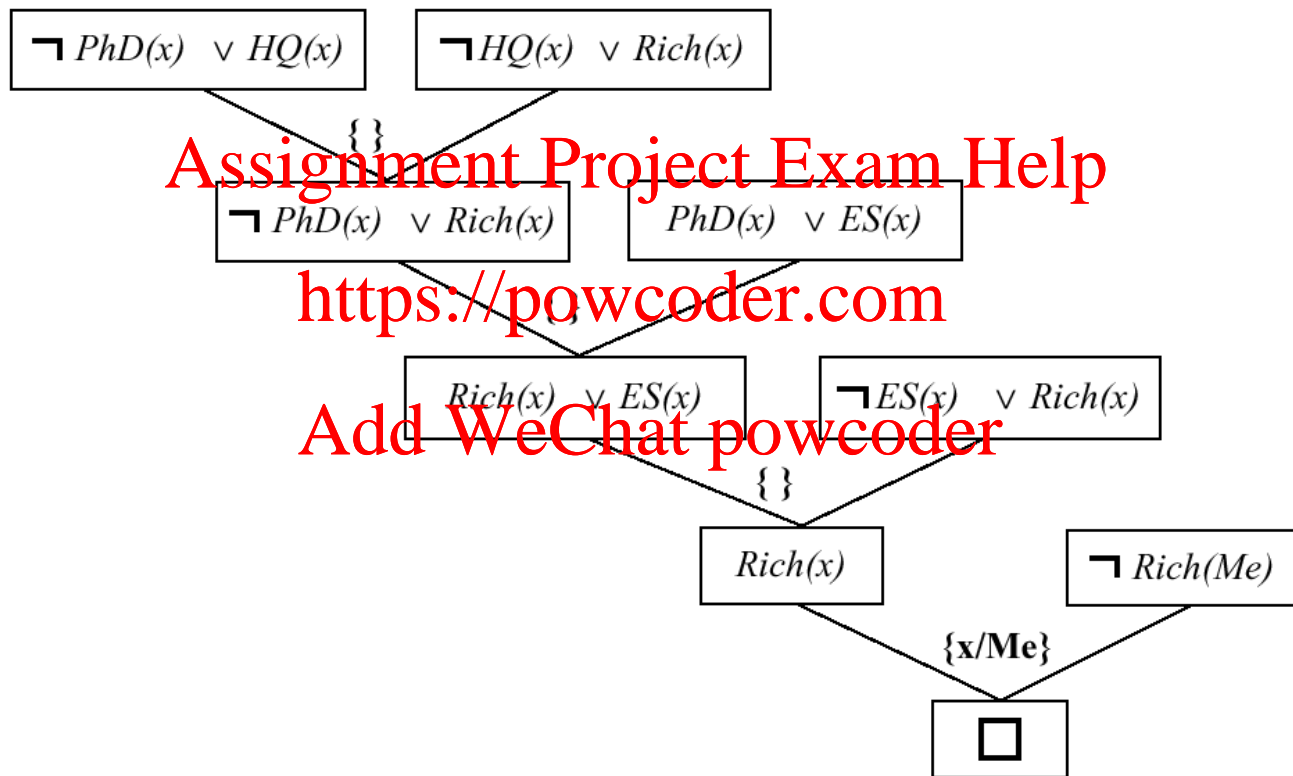

$\neg EarlyEarnings(x) \vee Rich(x)$
