#### **CSC384: Introduction to Artificial Intelligence**

# Constraint Satisfaction Problems (Backtracking Search) Assignment Project Exam Help

- Chapter 6 https://powcoder.com
  - 6.1: FormalismAdd WeChat powcoder
  - 6.2: Constraint Propagation
  - 6.3: Backtracking Search for CSP
  - 6.4 is about local search which is a very useful idea but we won't cover it in class.

#### **Representing States with Feature Vectors**

- For each problem we have designed a new state representation (and coded the sub-routines called by search to use this representation).
- Feature vectors provide a general state representation that is useful for many different problems.
- Feature vectors are the used of Al, particularly Machine Learning, Reasoning under Uncertainty, Computer Vision, etc.

#### **Feature Vectors**

- We have
  - A set of k variables (or features)
  - Each variable has a domain of different values.
  - A state is specified by an Pasigente Txafa Ville for each variable.
    - height = {shorthttps://paw.coder.com
  - weight = {light, average, heavy}
     Add WeChat powcoder
     A partial state is specified by an assignment of a value to some of the variables.

81 variables, each representing the value of a cell.

 Domain of Values: a single value for those cells that are already filled Anstigenment 1. Projetor Elxosa tellipthat are empty.

 https://powcoder.com
 State: any completed board given by specifying the value in each cell (1-9, or Mark) We Chat powcoder

Partial State: some (but not all) cells filled in

#### **Example: 8-Puzzle**

https://powcoder.com

• Variables: 9 variables Cell<sub>1</sub>, Cell<sub>1</sub>, ..., Cell<sub>3,3</sub> Add WeChat powcoder, and Cell<sub>3,3</sub>

• Values: {'B', 1, 2, ..., 8}

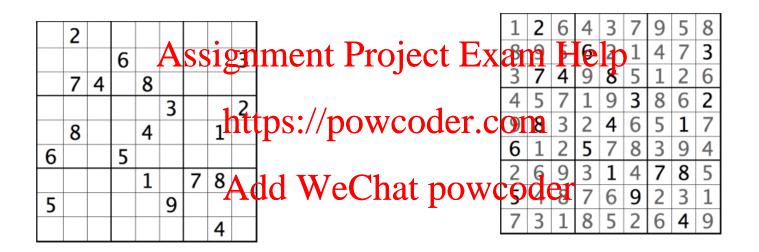

- State: Each "Cell<sub>i,j</sub>" variable specifies what is in that position of the tile.
  - If we specify a value for each cell we have completely specified a state.

This is only one of many ways to specify the state.

- Notice that in these problems some settings of the variables are illegal.
  - In Sudoku, we can't have the same number in any column, row, or subsquare.
  - In the 8 puzzle each yar ipble mutt have distinct value (same tile can't be in two places)

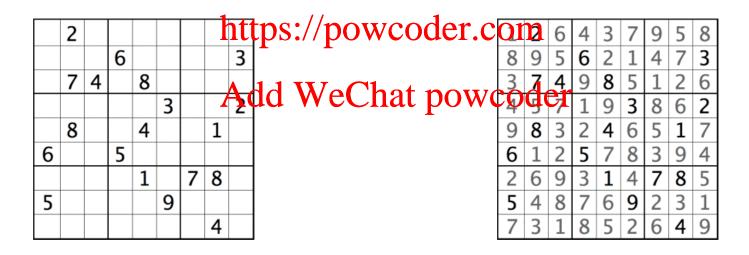

Add WeChat powcoder

• In many practical problems finding a legal setting of the variables is difficult.

 We want to find a state (setting of the variables) that satisfies certain constraints.

- In Suduko: The variables that form
  - a column must be distinct
  - a row must be distinct
  - a sub-squaressign hedisting ect Exam Help

- In these problems we do not care about the sequence of moves needed to get to a goal state.
- We only care about finding a setting of the variables that satisfies the goalgnment Project Exam Help
- A setting of the variables that satisfies some constraints.
   https://powcoder.com

   In contrast, in the 8-puzzle, the setting of the variables
- In contrast, in the 8-puzzle, the setting of the variables satisfying the goalds gwentwoods out the sequence of moves needed to move the tiles into that configuration.
  - In Search we care about finding a path to the goal state.
  - In CSPs we care about finding the goal state (not how to get there).

Car Factory Assembly Line—back to the days of Henry Ford Move the items to be assembled, don't move the workers

Max 2

Each car to be assemble ment alregist telegrand by pos.

We want to assign each car to be assembled to a slot on the line.

But we want to ensure that no sequence of 4 slots has more than 2 cars assigned that require a war Chat. powcoder

Finding a feasible assignment of cars with different options to slots without violating the capacity constraints of the different stations is hard.

- A CSP consists of
  - A set of variables V<sub>1</sub>, ..., V<sub>n</sub>
  - For each variable a (finite) domain of possible values Dom[V<sub>i</sub>]. Assignment Project Exam Help
  - A set of constraints: Proweoder.com

Add WeChat powcoder

- Each variable can be assigned any value from its domain.
  - Vi = d where d ∈ Dom[Vi]
- Each constraint C
  - Constraina asparticular retief variable Hit is over, called its scope
    - E.g., C(V1, V2h) is/aponstraide pyenthe variables V1, V2, and V4. Its scope is {V1, V2, V4}
  - Given an assightive of the constraint returns:
    - True—this assignment satisfies the constraint
      - e.g., C(V1=a, V2=b, V4=c)  $\rightarrow$  True
    - False—this assignment falsifies the constraint.
      - e.g., C(V1=a, V2=b, V4=a)  $\rightarrow$  False

- We can specify the constraint with a table
- C(V1, V2, V4) with Dom[V1] = {1,2,3} and Dom[V2]
   = Dom[V4] = {1, 2}

v <sub>1</sub> Assi	gnment Pr	oject <sub>4</sub> Exar	1 <b>L.G./2</b> ,V4)
1	1	1	False
1	https://poy	vcoder.cor	n False
1	2	1	False
1	Add WoC	hat powco	False
2	Add <sub>1</sub> WCC	nat powco	True
2	1	2	False
2	2	1	False
2	2	2	False
3	1	1	False
3	1	2	True
3	2	1	True
3	2	2	False

 Often we can specify the constraint more compactly with an expression:
 C(V1, V2, V4) = (V1 = V2+V4)

v <sub>1</sub> Assi	gnment Pr	oject <sub>4</sub> Exar	n <b>L. (3, 12</b> , 14)

    - All-Diff(V<sub>21</sub>, V<sub>22</sub>, V<sub>23</sub>, ..., V<sub>29</sub>)
    - ..., All-Diff(V<sub>91</sub>Avdd...WgChat powcoder
  - Column Constraints:
    - All-Diff(V<sub>11</sub>, V<sub>21</sub>, V<sub>31</sub>, ..., V<sub>91</sub>)
    - All-Diff(V<sub>21</sub>, V<sub>22</sub>, V<sub>13</sub>, ..., V<sub>92</sub>)
    - ...., All-Diff(V<sub>19</sub>, V<sub>29</sub>, ..., V<sub>99</sub>)

- Variables: V<sub>11</sub>, V<sub>12</sub>, ..., V<sub>21</sub>, V<sub>22</sub>, ..., V<sub>91</sub>, ..., V<sub>99</sub>
- Domains:
  - Dom $[V_{ii}]$  = {1-9} for empty cells
  - Dom $[V_{ii}] = \{k\}$  a fixed value k for filled cells.
- Constraints: Assignment Project Exam Help
  - Row constraints:
    - All-Diff(V<sub>11</sub>, V<sub>1</sub>), ttps://powcoder.com
    - All-Diff(V<sub>21</sub>, V<sub>22</sub>, V<sub>23</sub>, ..., V<sub>29</sub>)
    - ...., All-Diff(V<sub>91</sub>Avdd...WgChat powcoder
    - Column Constraints:
      - All-Diff(V<sub>11</sub>, V<sub>21</sub>, V<sub>31</sub>, ..., V<sub>91</sub>)
      - All-Diff(V<sub>21</sub>, V<sub>22</sub>, V<sub>13</sub>, ..., V<sub>92</sub>)
      - ...., All-Diff(V<sub>19</sub>, V<sub>29</sub>, ..., V<sub>99</sub>)
    - Sub-Square Constraints:
      - All-Diff(V<sub>11</sub>, V<sub>12</sub>, V<sub>13</sub>, V<sub>21</sub>, V<sub>22</sub>, V<sub>23</sub>, V<sub>31</sub>, V<sub>32</sub>, V<sub>33</sub>)
      - ..., All-Diff(V<sub>77</sub>, V<sub>78</sub>, V<sub>79</sub>,..., V<sub>97</sub>, V<sub>98</sub>, V<sub>99</sub>)

• Thus Sudoku has 3x9 ALL-DIFF constraints, one over each set of variables in the same row, one over each set of variables in the same column, and one over each set of variables in the same column, and the same the column and the same of the column and the same of the column.

https://powcoder.com

Add WeChat powcoder

- Each of these constraints is over 9 variables, and they are all the same constraint:
  - Any assignment to these 9 variables such that each variable has a different value <u>satisfies</u> the constraint.
  - Any assignment where two oppose variables have the same value falsifies the constraint.

#### https://powcoder.com

- This is a special kind of constraint called an ALL-DIFF constraint.
  - ALL-Diff(V1, .., Vn) can also be encounted as set of binary not-equal constraints between all possible pairs of variables:

- But this collection of binary constraints has less pruning power under GAC (as we will see later)
- ALL-DIFF appears in many CSP problems.

#### **CSP** as a Search Problem

# A CSP could be viewed and solved as a traditional search problem

- However, CSPs do not require finding a path (to a goal). They ignly me Expire Configliation of the goal state.
   https://powcoder.com
- Traditional search is an **inefficient** way to solve CSPs because it does not exploit the additional structure of the problem.
- This additional structure can be exploited in a process called constraint propagation.

# **Solving CSPs**

 CSPs are best solved by a specialized version search called Backtracking Search.

Key intuitions:

- We can build up to a solution by searching through the space of partial assignments (rather than paths)
- Order in which we dispoint the Variables does not change the correctness of search eventually they all have to be assigned. It can have a huge impact doll the earth of the conderwe can decide on a suitable value for one variable at a time!
- If we falsify a constraint during the process of building up a solution, we can immediately reject the current partial assignment:
  - All extensions of this partial assignment will falsify that constraint, and thus none can be solutions.
  - This is the key idea of backtracking search.

# **Backtracking Search**

- Specialized version of depth first search
- Explores partial assignments to the variables.
- A node is terminated if it violates a constraint Assignment Project Exam Help
- A node specifying a total assignment is a solution.

#### Add WeChat powcoder

Backtracking Search is one of the fundamental Computer Science Algorithms (Knuth "The Art of Computer Programming" Volume 4A is devoted to Backtracking Search)

# **Backtracking Search-Support Functions**

- Class Variable—various member functions to deal with individual variables
  - .domain()
     Returns list of values in variable's domain
  - .domain Size (Inment Project Exam Help Returns number of values in domain
  - .getValue() / .setValue() vcoder.com
    Gets/sets variable's current assigned value. variable is unassigned if and only if its current assigned value is None
  - .isAssigned()
     Returns True/False if variable has an assigned value (i.e., its getValue() != None)
  - .name()
     Returns string specifying the variable's name (for documenting the CSP model)

# **Backtracking Search-Support Functions**

- Class Constraint—various member functions to deal with individual constraints
  - .scope()
     Returns list of variables in the constraint's scope.
  - .arity()
    Returns numbig of the light of th
  - .numUnassigned()
    Returns number of variables in constraint's scope that are not assigned. (Other variables have been assigned)
    Add WeChat powcoder
  - .check()
     Returns True if the values currently assigned to the variables in .scope() satisfy the constraint. False if not.
     If .numUnassigned() > 0 returns True (not yet able to check that the constraint is falsified).
  - name()
     Returns string specifying the constraint's name

# Backtracking Search-What variable to assign next?

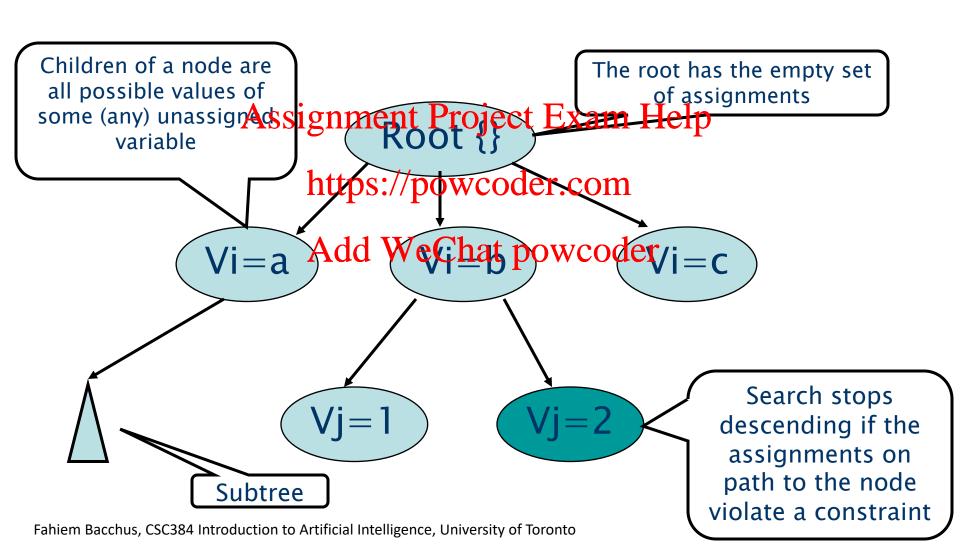

- The decision of which variable to assign next does not affect whether or not backtracking search will find a solution.
- But it does have a tremendous impact on efficiency!

  Assignment Project Exam Help
  tremendous impact on efficiency!

Add WeChat powcoder

# **Backtracking Search**

The algorithm searches a tree of partial assignments.

# **Backtracking Search**

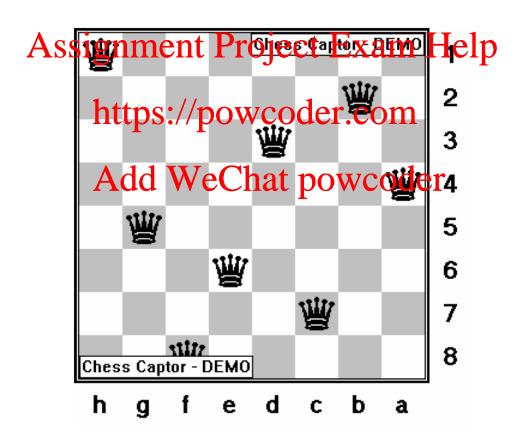

- Heuristics are used to determine
  - the order in which variables are assigned: UnAssignedVars.extract()
  - determines the order of values tried for each variable.
  - As in search, tighteettorpient be kept in heuristic order so that we always select the first variable.
    But the best variable can change every time we assign another
  - But the best variable can change every time we assign another variable.
     Add WeChat powcoder
  - Variable. Add WeChat powcoder
     In general, the best variable depends on the collection of assigned variables as well as the values these variables have been assigned.

# **Backtracking Search**

- Hence, the choice of the next variable can vary from branch to branch, e.g.,
  - under the assignment V1=a we might choose to assign V4 next, while under V1=b we might choose to assign V5 next.
     Assignment Project Exam Help
- This "dynamically" chosen variable ordering can have a tremendous impact on performance.

Add WeChat powcoder

 Place N Queens on an N X N chess board so that no Queen can attack any other Queen.

- Problem formulation:
  - N variables (N queens)
  - N<sup>2</sup> values for each variable representing the positions on the chessboard

      Add WeChat powcoder

- This representation has (N²)<sup>N</sup> states (different possible assignments in the search space)
  - For 8-Queens: 64<sup>8</sup> = 281,474,976,710,656
     Assignment Project Exam Help
- Is there a bether way to to depresent the N-queens problem?
  - Add WeChat powcoder

     We know we cannot place two queens in a single row

     we can exploit this fact in the choice of the CSP representation

- Better Modeling:
  - N variables Qi, one per row.
  - Value of Qi is the column the Queen in row i is placed; possible values {1, ..., N}.

https://powcoder.com

- This representation to the state of the st
  - For 8-Queens:  $8^8 = 16,777,216$

 The choice of a representation can make the problem solvable or unsolvable!

#### Constraints:

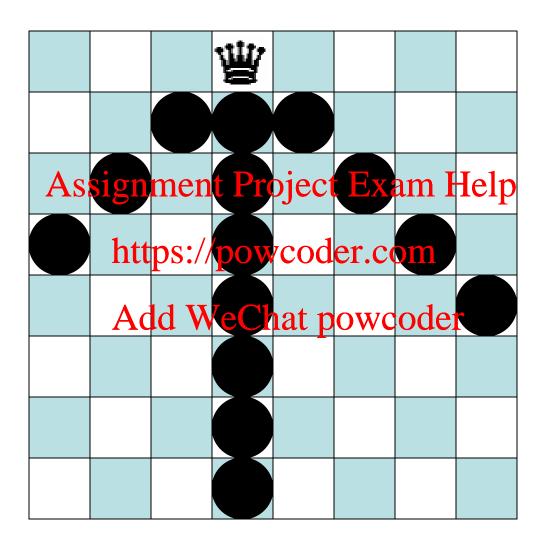

- Can't put two Queens in same column

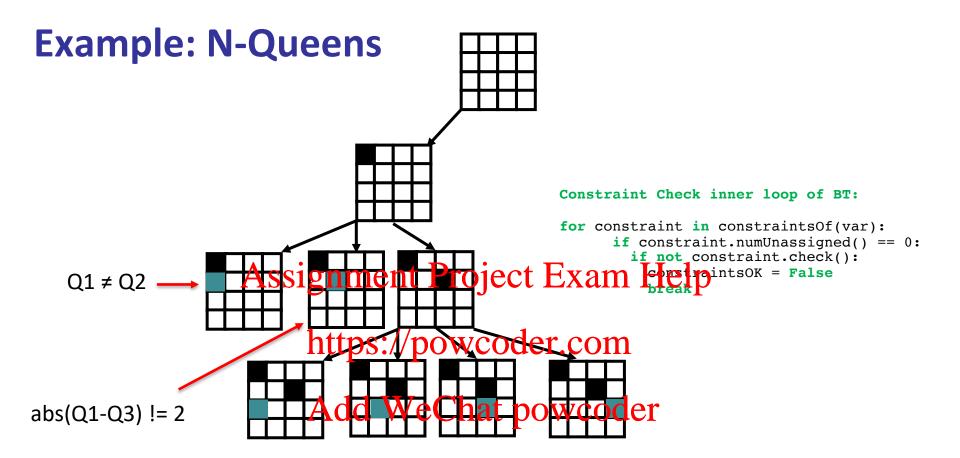

- Diagonal constraints

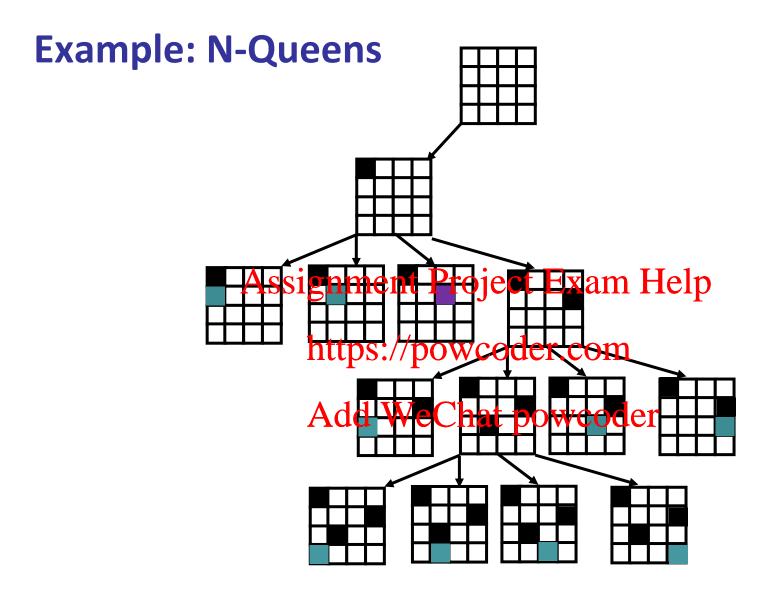

abs(Qi-Qj) ≠ abs(P-j/powcoder.com

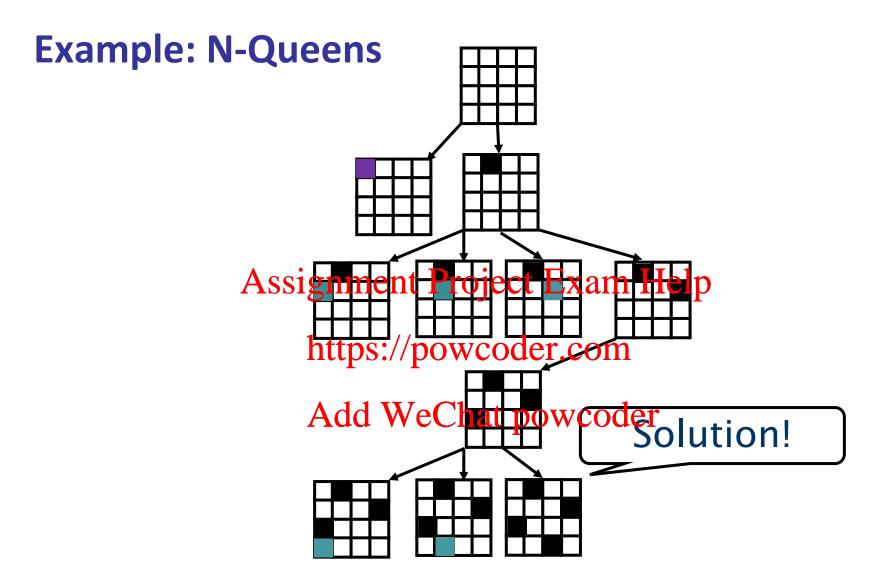

- i.e., the difficience we contain the difference between i and j.
- E.g. 4 Queens:

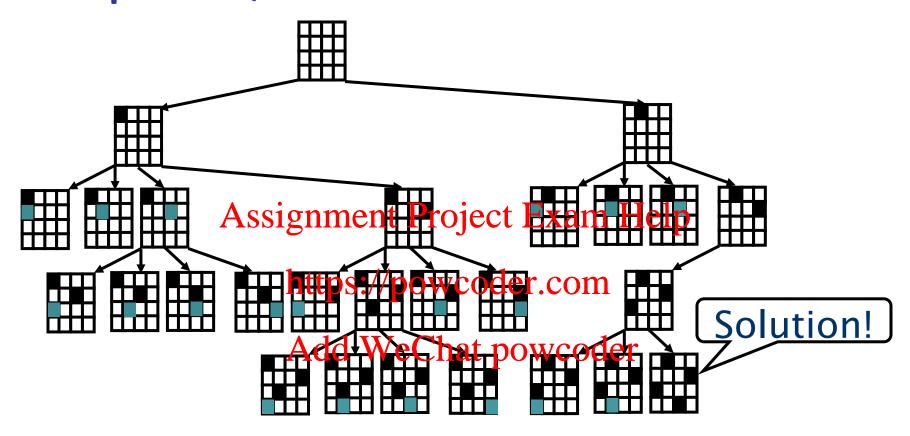

```
Q1 \neq Q2, Q1 \neq Q3, Q1 \neq Q4, Q2 \neq Q3, Q2 \neq Q4, Q3 \neq Q4, abs(Q1-Q2) != 1, abs(Q1-Q3) != 2, abs(Q1-Q4) != 3, abs(Q2-Q3) != 1, abs(Q2-Q4) != 2, abs(Q3-Q4) != 1
```

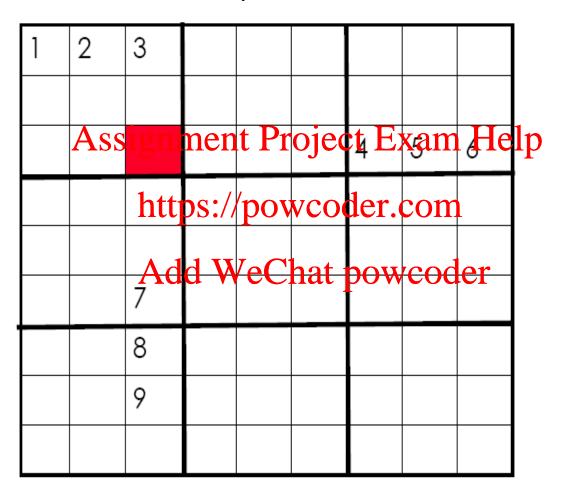

# **Problems with Plain Backtracking**

Sudoku: The 3,3 cell has no possible value.

# **Problems with Plain Backtracking**

• In the backtracking search we won't detect that the (3,3) cell has no possible value until all variables of the row/column (involving row or column 3) or the sub-square constraint (first sub-square) are assigned.

So we have the following situation: Assignment Project Exam Help Variable has no possible dd WeChatvpluw,dodene don't detect this. Until we try to assign it a value

Leads to the idea of constraint propagation/domain filtering

# **Constraint Propagation**

 Constraint propagation refers to the technique of "looking ahead" at the yet unassigned variables in the search.

#### Assignment Project Exam Help

• Try to detect obvious failures: "Obvious" means things we can test/detect efficiently.

#### Add WeChat powcoder

 Even if we don't detect an obvious failure we might be able to eliminate some possible part of the future search.

### **Constraint Propagation**

- Propagation has to be applied during the search; potentially at every node of the search tree.
- Propagation itself is an inference step that needs some resources (in particular, it requires time)
   If propagation is slow, this can slow the search down to the
  - If propagation is slow, this can slow the search down to the point where using propagation makes finding a solution take longer!
  - There is always a tradeoff between searching fewer nodes in the search, and having a higher nodes/second processing rate.
  - A similar tradeoff occurs if we try to compute an expensive heuristic in A\* search—we might expand fewer nodes but take more time.
- We will look at two main types of propagation: Forward Checking & Generalized Arc Consistency

# **Constraint Propagation: Forward Checking**

 Forward checking is an extension of backtracking search that employs a "modest" amount of propagation (look ahead).

#### Assignment Project Exam Help

- For that uninstantiated variable, we check all of its values, pruning those values that violate the constraint.

- During search the domains of unassigned variables (future variables) can be pruned because these values are incompatible with the values given to currently assigned variables.
- During backthackingsear Project Wilkhem Haklpg new variable assignments, and undoing them when we backtrack. https://powcoder.com

Add WeChat powcoder

- Hence an important component of algorithms that use constraint propagation is that
  - 1. They must have facilities to prune values from the domains of the future variables—we have to **keep track** of the unpruned values remaining for the future variables.

    https://powcoder.com
  - 2. They must also have the facility to **restore** pruned values to the dom wire of the order variables on backtrack when we undo some variable assignments.
    - This is accomplished by keeping track of which variable assignment caused the pruning to occur, and then restoring the values pruned by that variable assignment when it is undone by backtracking

- Additional member functions/variables for Variable class
  - .curDomain()
     Returns list of variable's current values (the currently unpruned values).
  - .curDomainSize()
    Returns number of variable's current values. Help
  - .pruneValue(value, assigned var assigned\_val)
     Removes value from variable's current values. Remembers that assigned\_var being assigned assigned val' is the reason this value is being pruned

- Additional member function for Constraint class
  - .unassignedVars()
     Returns list of unassigned variables in constraint's .scope()
     (variable is unassigned if its current value is None)
- Additional function Project Exam Help
  - restoreValues(variable, value)
    returns all values prepared perause of the passed variable value assignment to the current domain of their respective variable.

Add WeChat powcoder

# Forward Checking (detect values to prune)

        if FCCheck(C, var, val) == "DWO" #prune future variables
          noDwo = False
                                          #pass var/val as reason
          break
    if noDwo:
      FC(unassignedVars)
    restoreValues(var, val)
                              #restore values pruned by this assignent
  var.setValue(None)
                              #undo assignemnt to var
  unAssignedVars.insert(var)
                              #restore var to unAssignedVars
  return
```

# Forward Checking-initial call

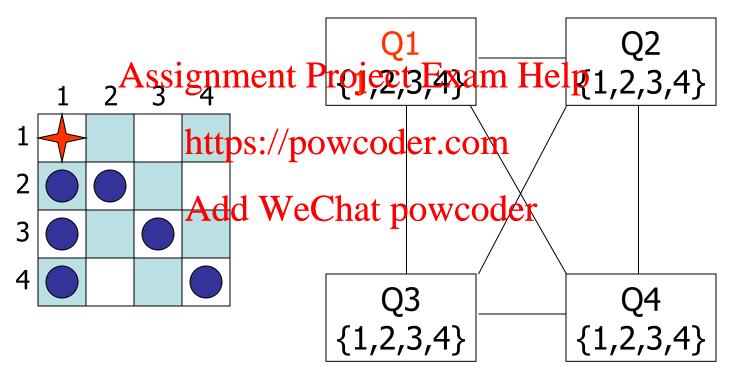

- Initially all variables are unassigned
- Initially unAssignedVars contains all variables

Assignment Project Exam Help

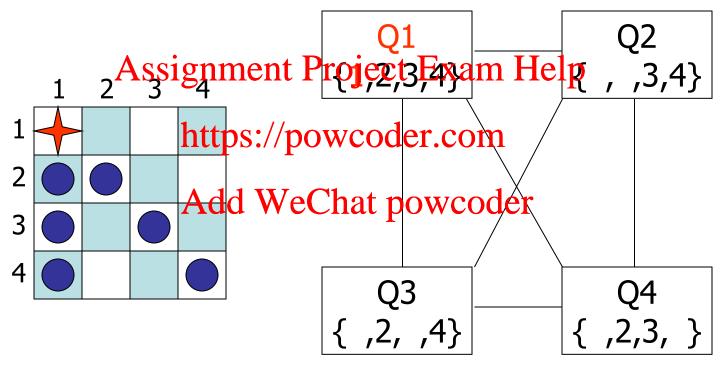

https://powcoder.com

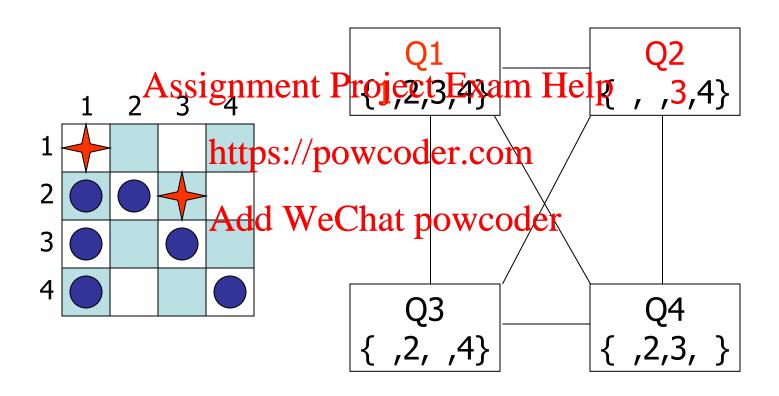

Add WeChat powcoder

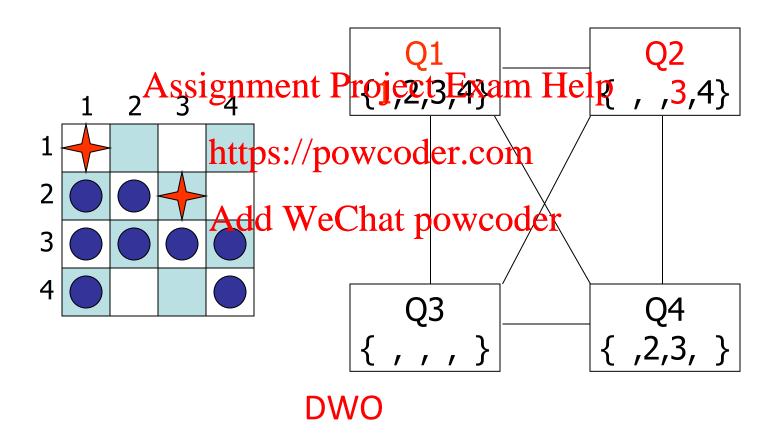

- Encoding with Q1, ..., Q4 denoting a queen per row
  - cannot put two queens in same column. Binary constraint between every pair of variables.

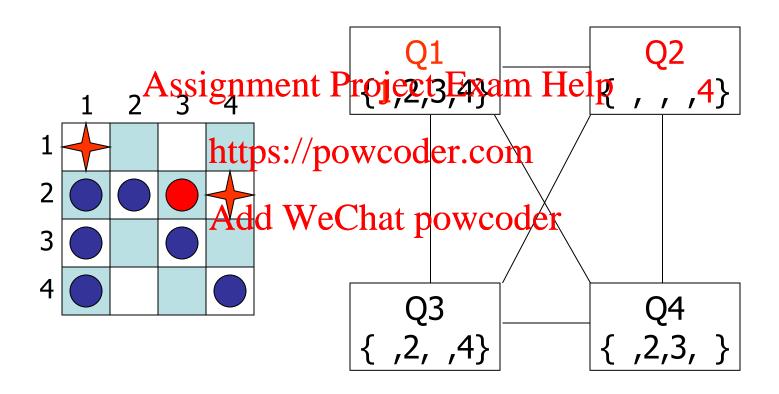

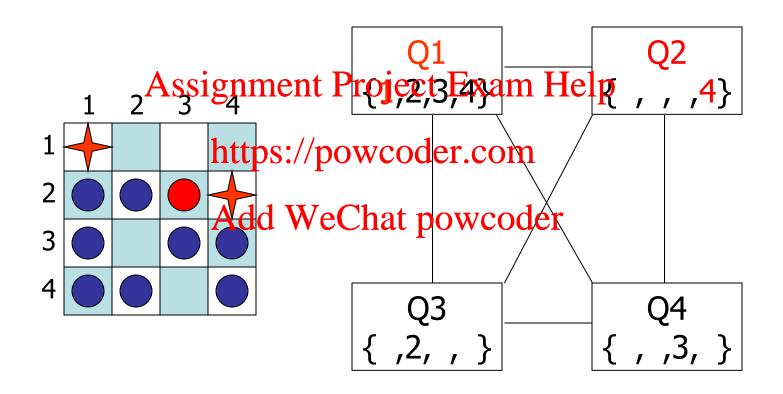

- Forward checking reduced the domains of all variables that are involved in a constraint with one unassigned variable:
  - each binary constraint with Q1

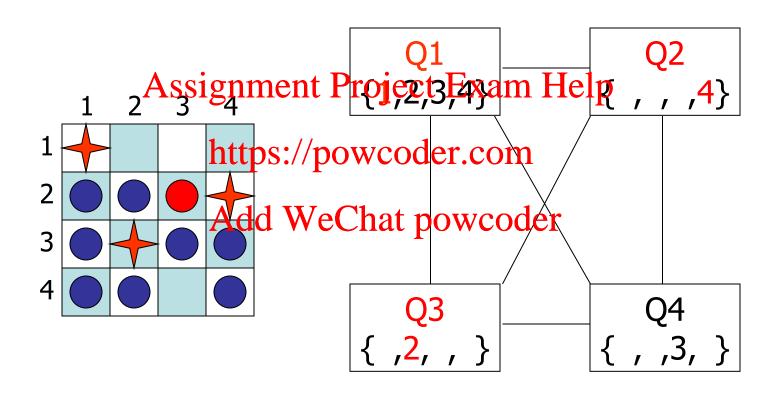

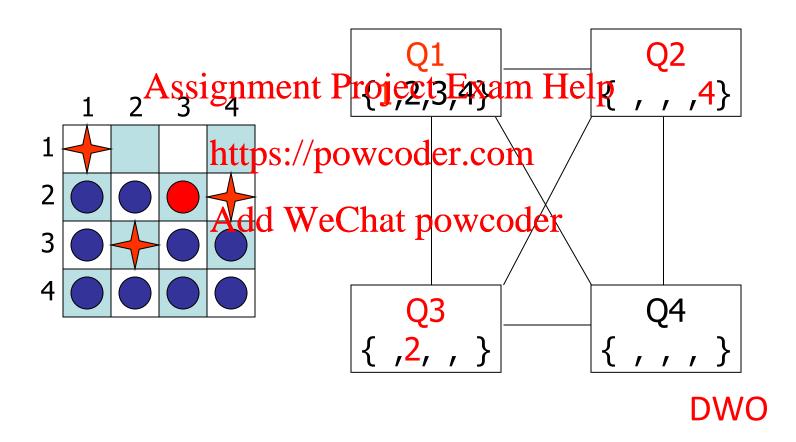

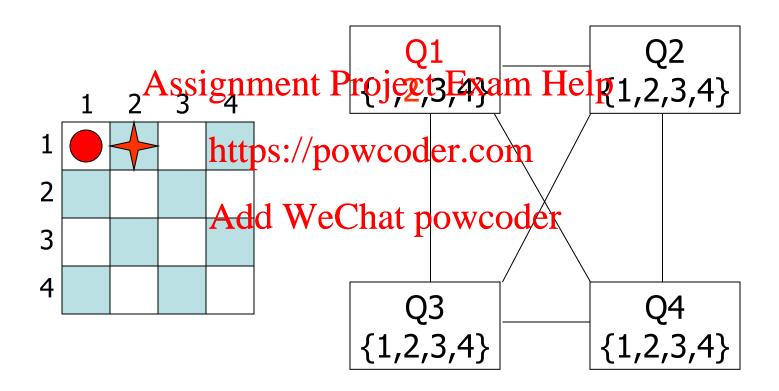

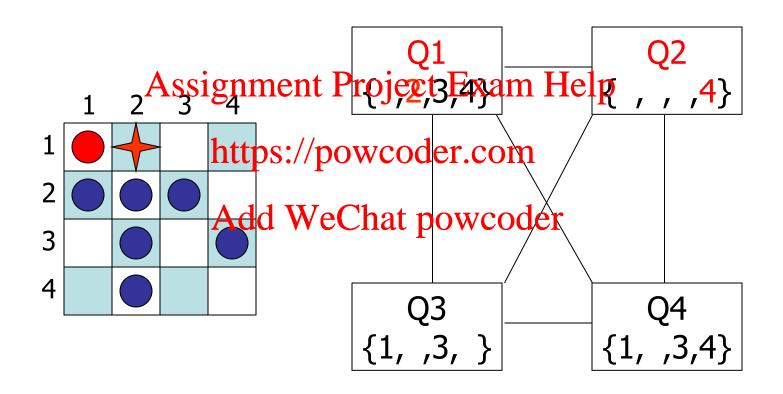

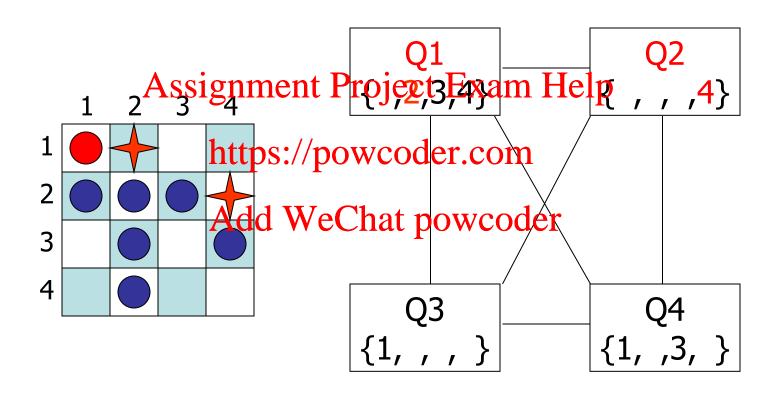

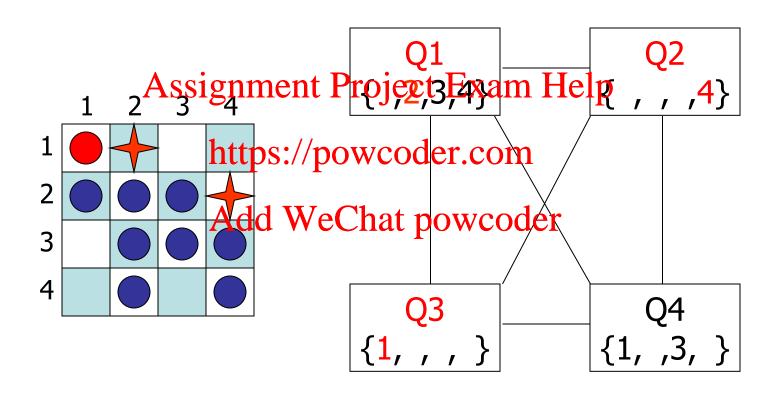

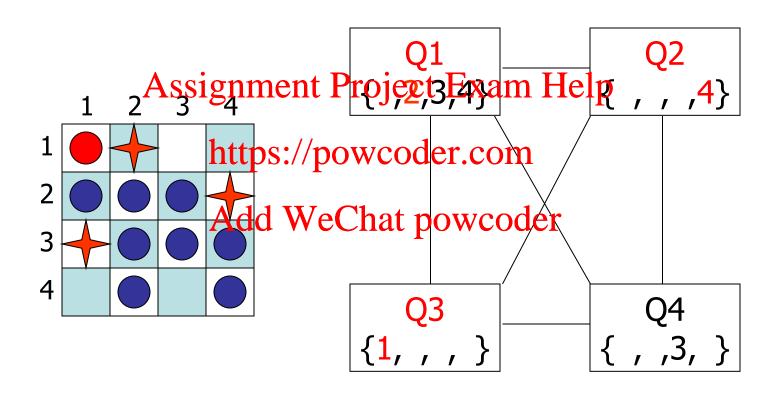

Exhausted the subtree with Q1=1; try now Q1=2

 We have now find a solution: an assignment of all variables to values of their domain so that all constraints are satisfied

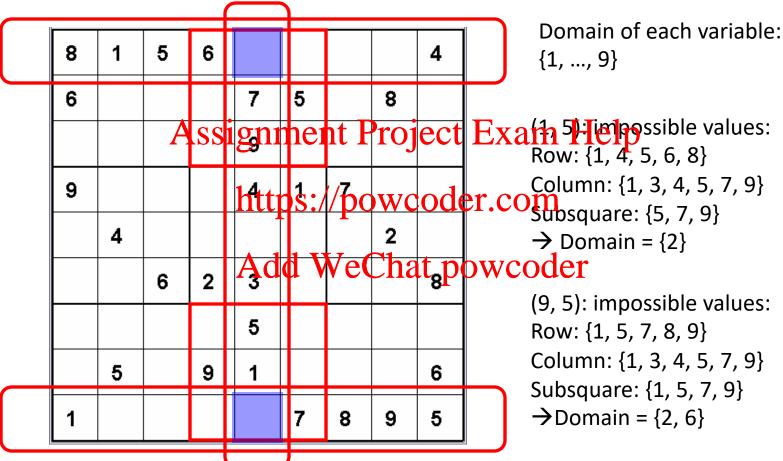

## FC: Minimum Remaining Values Heuristics (MRV)

- FC also gives us for free a very powerful heuristic to guide us which variables to try next:
  - Always branch on a variable with the smallest remaining values (smallest .curDomainSize()).
  - Assignment Project Exam Help

     If a variable has only one value left, that value is forced, so we should assign it and propagate its consequences right away
  - This heuristic tends to produce skinny trees at the top. This
    means that more variables can be wisted at a with fewer
    nodes searched, and thus more constraint propagation/DWO
    failures occur when the tree starts to branch out (we start
    selecting variables with larger domains)
  - We can find a inconsistency much faster

## **MRV** Heuristic: Human Analogy

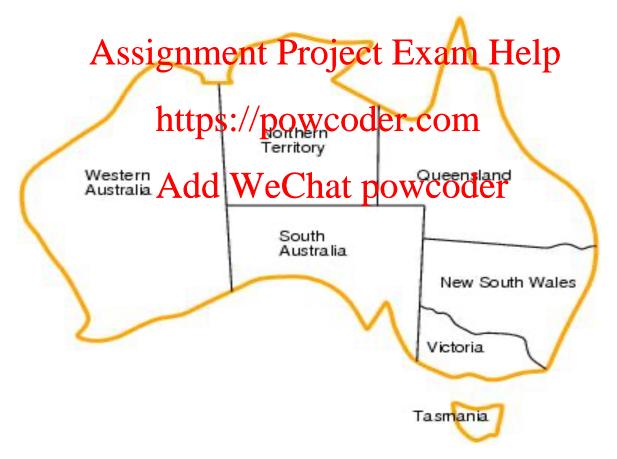

What variables would you try first?

Most restricted variables! = MRV

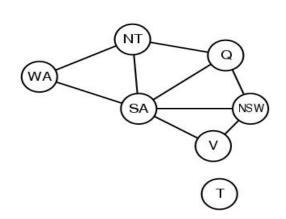

After assigning value 2 to cell (1,5): Domain of (9,5) = {6}

 Color the following map using red, green, and blue such that adjacent regions have different colors.

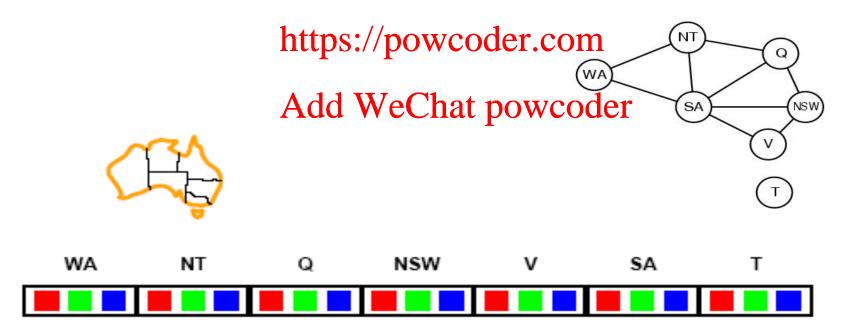

- Modeling
  - Variables: WA, NT, Q, NSW, V, SA, T
  - Domains: D;={red, green, blue}
     Assignment Project Exam Help
     Constraints: adjacent regions must have different
  - Constraints: adjacent regions must have different colors.
     https://powcoder.com

• E.g. WA ≠ NAdd WeChat powcoder

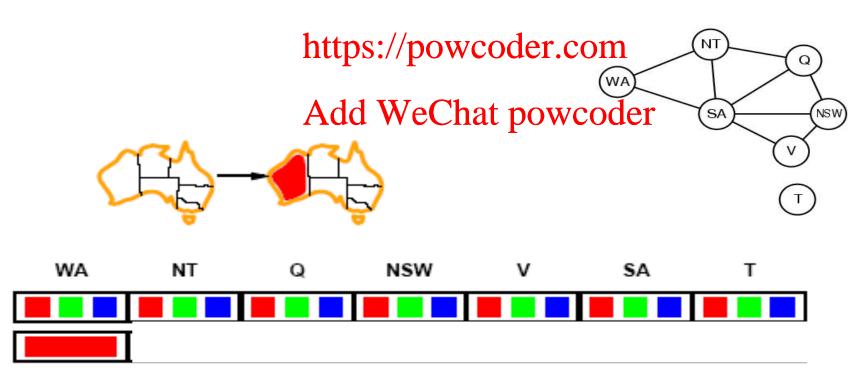

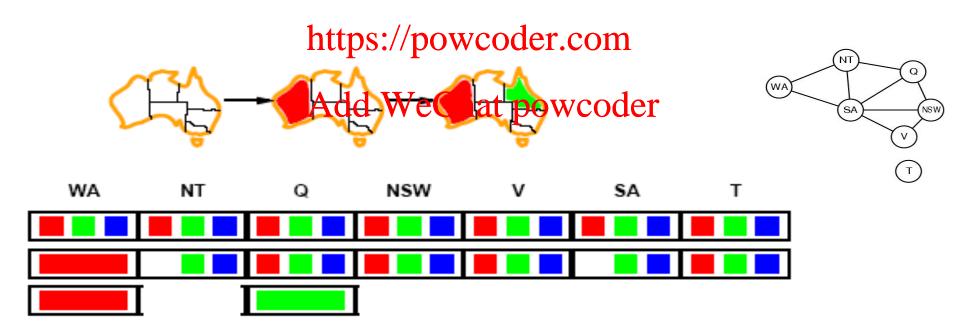

- Forward checking: keep track of remaining legal values for unassigned variables.
- Terminate search when any variable has no legal values.

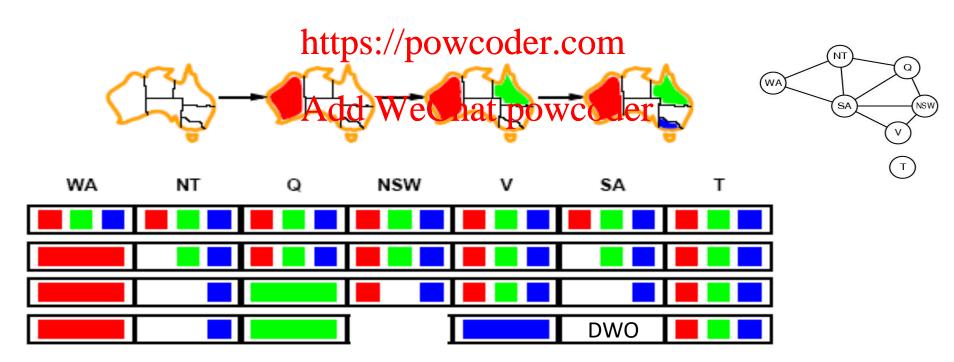

Assign {WA=red}

- Effects on other variables connected by constraints to WA
  - NT can no longer be red
  - SA can no longer be red
- Assign {Q=green} (Note: Not using MRV)

- Effects on other variables connected by constraints with Q
  - NT can no longer be green
  - NSW can no longer be green
  - SA can no longer be green
- Assign {V=blue} (not using MRV) ect Exam Help

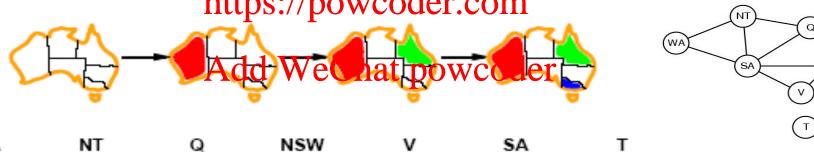

- Assign {V=blue} (not using MRV)
- Effects on other variables connected by constraints with V
  - NSW can no longer be blue
  - SA is empty

Assignment Project Exam Help

FC has detected that partial assignment is inconsistent with the constraints and backtracking can occur.

https://powcoder.com

# **Empirically**

- FC often is about 100 times faster than BT
- FC with MRV (minimal remaining values) often 10000 times faster.
- But on some prohimms the speed unch greater
  - https://powcoder.com

     Converts problems that are not solvable to problems that are solvable.

    Add WeChat powcoder
- Still FC is not that powerful. Other more powerful forms of constraint propagation are used in practice.
- Try the previous map coloring example with MRV.

## **Constraint Propagation:** Generalized Arc Consistency

- GAC—Generalized Arc Consistency is the most commonly used domain filtering (propagation) method used.
- Plain Backtracking check a constraint only when it has .numUnassigned() = 0
- Forward checks propostraint only when it has .numUnassigned() = 1
- GAC checks all cdrtspsaintolisteractsmo much more pruning in general.
  - GAC ensures that all constraints patys of consistency (called GAC!) with respect to the already assigned variables
  - This level of consistency is achieved by pruning values from the domains of the unassigned variables.
  - Even at the root before any variables have been assigned, we can get some pruning by making the constraints GAC consistent.

## **Constraint Propagation:** Generalized Arc Consistency

First we define formally the notion of consistency.

1. A constraint, C(V<sub>1</sub>, V<sub>2</sub>, V<sub>3</sub>, ..., V<sub>n</sub>) is GAC with respect to variable Vi, if and only if Assignment Project Exam Help

For every value  $V_1$ ,  $V_2$ ,  $V_{i-1}$ ,  $V_{i+1}$ ,  $V_i$ 

#### **Constraint Propagation:** Generalized Arc Consistency

2. C(V1, V2, ..., Vn) is GAC if and only if

It is GAC with respect to every variable in its scope.

Assignment Project Exam Help

3. A CSP is GAC https://powygqder.com

Add WeChat powcoder all of its constraints are GAC.

So we achieve GAC by achieving GAC for each constraint, and we achieve GAC for a constraint by achieving for every variable in the constraint's scope.

## **Constraint Propagation: GAC**

- Achieving GAC for a constraint with respect to a particular variable:
  - Say we find a value d of variable Vi that is not consistent: That is, there is no assignments to the other variables that satisfy the constraint when Vi = d
  - d is said to be Arc Inconsistent
  - We can remove d from the domain of Vi—this value cannot lead to a solution (much like For Assi greatent to the form the project of the form of the project of the form of the for
- e.g. C(X,Y): X>Y Dom**(X)P**§1,5**PPIY** 606€(¥)⊆(93,8,15)

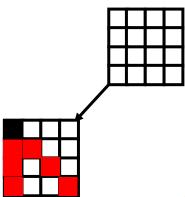

- Add WeChat powcoder

   For X=1 there is no value of Y s.t. 1>Y => so we can remove 1 from domain X
- For Y=15 there is no value of X s.t. X>15, so remove 15 from domain Y
- We obtain the more restricted domains Dom(X)={5,11} and  $Dom(Y) = \{3,8\}$

## **Constraint Propagation: GAC**

- Propagation: pruning the domain of a variable to make a constraint GAC can make a different constraint no longer GAC
- C1(X,Y): X>Y
  C2(Y,Z): Z<Y</li>
  Dom(X)={1,5,11}, Dom(Y)={3,8,15}, Dom(Z) = {4,6}
  Assignment Project Exam Help
  Make C1 GAC by pruning value 1 from Dom(X), and value 15 from
- Make C1 GAC by pruning value 1 from Dom(X), and value 15 from Dom(X) = {5,11}
   https://powcoder.com
   Dom(Y) = {3,8}
- Make C2 GAC by pruhing Wale Battopo Dom(N)r
   Dom(Y) = {8}
   Dom(Z) = {4, 6}
- Now C1 is no longer GAC (if X=5 there is no value for Y)

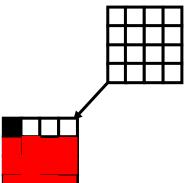

We need to re-achieve GAC for some constraints whenever a domain value is pruned.

#### Assignment Project Exam Help

GAC immediately detects/appeweoder.com

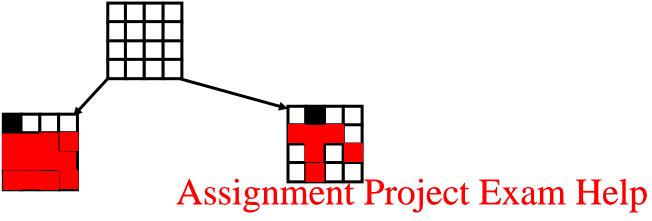

- 1. When we assign V1 = 1 we reduce Dom(V1) = {1}. V1's value is fixed. Add WeChat powcoder
- Prune V2=1, V2=2, V3=1, V3=3, V4=1, V4=4—these values inconsistent with Dom(V1) = {1}
   Dom(V2) = {2,3}, Dom(V3) = {2,4}, Dom(V4) = {2,3}
   Same as Forward Checking to this point

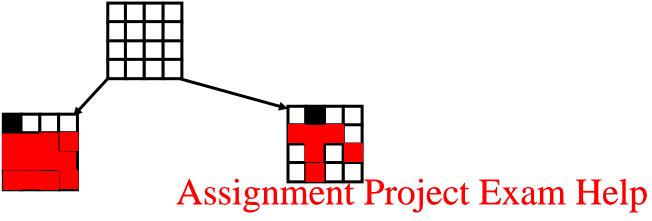

#### Assignment Project Exam Help

GAC immediately dettersts/applwooder.com

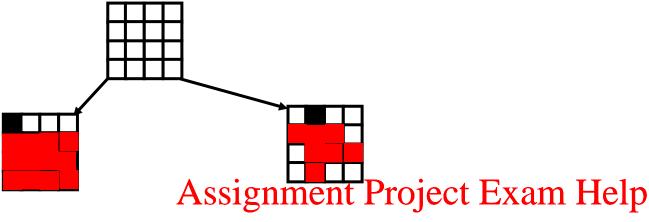

- 3. Dom(V2) = {3,4}, Dom(V3) = {2,4}
  V2 = 3 has no compatible V2 value
  Dom(V2) = {4}, Dom(V3) = {2)
- 4. Dom(V3) = {2}, Dom(V4) = {2, 3}V3=2 has no compatible V4 valueDom(V3) = {}
- 5. DWO

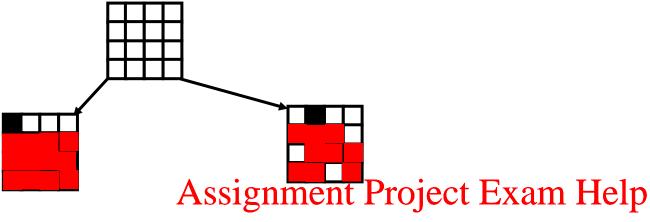

1. V2=1, V2=2, V2=3, V3=2, V3=4, V4=2, all pruned. Incompatible with Dom(V1) =  $\{2\}$  Dom(V2) =  $\{4\}$ , Rom(V3) =  $\{1,3,4\}$ 

- 1. V2=1, V2=2, V2=3, V3=2, V3=4, V4=2, all pruned. Incompatible with Dom(V1) =  $\{2\}$ . Dom(V2) =  $\{4\}$ , Rom(V3) =  $\{1,3,4\}$ .
- 2. V3=3 has no compatible V2 value Dom(V3) = {1}

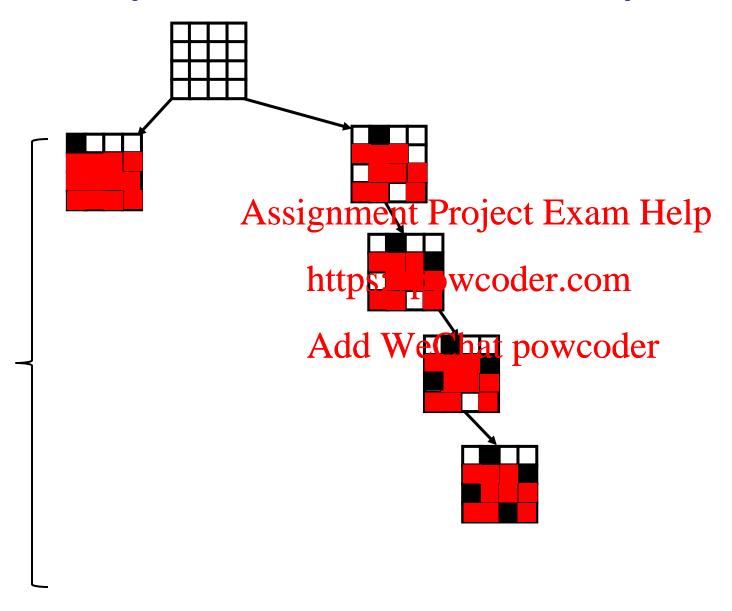

- 1. V2=1, V2=2, V2=3, V3=2, V3=4, V4=2, all pruned. Incompatible with  $Dom(V1) = \{2\}$  Powcoder.com  $Dom(V2) = \{4\}$ ,  $Pom(V3) = \{1,3,4\}$
- 2. V3=3 has no compatible V2 value Dom(V3) = {1}
- V4=1 has no compatible V3 value.
   V4=4 has no compatible V2 value.
   Dom(V4) = 3

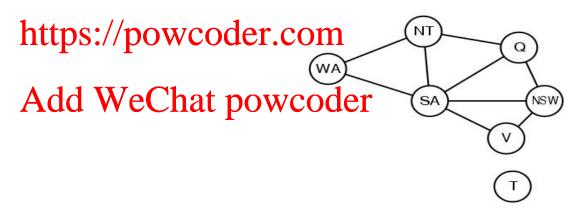

- 2. V3=3 has no compatible Wellhat powcoder Dom(V3) = {1}
- 3. V4=1 has no compatible V3 value. V4=4 has no compatible V2 value. Dom(V4) = 3

Now search no longer has to branch—only one value left for each variable. So it just walks down to a solution assigning each variable in turn.

- Assign {WA=red}
- Effects on other variables connected by constraints to WA
  - NT can no longer be red = {G, B}
- SA can no longer be red = {G, B}
   Assignment Project Exam Help
   All other values are arc-consistent

- Assign {Q=green}
- Effects on other variables connected by constraints with Q
  - NT can no longer be green = {B}
  - NSW can no longer be green = {R, B}
- SA can no longer be green = {B}

  DWO SA=B has no compatible NT value

  Exam Help

https://powcoder.com
Note Forward Checking would not have detected this DWO.

Add WeChat powcoder

## **GAC Algorithm**

- Like FCcheck, GacEnforce makes all constraints GAC by pruning variable values.
- GacEnforce does much more pruning than FCCheck.
- As we noted before, making one constraint GAC might make another constraint grantenge one constraint GAC might make continually iterate over the constraints until all are GAC.
  - This is accomplished by having a list of constraints that need to be made GAC.
  - Constraints are added back to the list if they might no longer be GAC
  - GacEnforce stops when the list is empty.

## **GAC Algorithm**

- Say a constraint C(V1, V2, ..., Vk) is GAC. What can make it non-GAC?
- GAC condition: for every value di ∈ curDomain(Vi) there exists values in d1 ∈ curDomain(V1), ..., di-1 ∈ curDomain(Vi-1), di+1 ∈ curDoma

- This tuple of values (one for every variable, and with Vi=di) is said to be a support or a supporting tuple for Vi=di in constraint C.
- A constraint C is GAC if for every variable Vi in its scope, every value di ∈ curDomain(Vi) has a support in C

## **GAC Algorithm**

- So a constraint can only become non-GAC (when previously it was GAC) when some variable in its scope has a value that loses support.
- How can support be lost?
  - The constraint spigen heanger it will still based if letter the supporting tuple.
  - But the tuple might tye: Inposigrocelety is dimuch that di is no longer in curDomain(Vi)
- So if a variable in its stope has tall an available in available in its stope has tall an available in available in its
- If no values have been pruned → constraint is still GAC

We use this insight to decide when to put a constraint back on the list to be checked.

## **GAC**—Support Functions

- Additional member function for Constraint class
  - .hasSupport(var, val)
     Returns true if var=val has a supporting tuple in constraint.

#### Can be implemented in various ways:

- 1. Iterate over a Assisible as ignificated to Executive out by the second constraint, (values from their current domain) to see if any combination along with var=val satisfies/the wonstlein com
- 2. Store all the supporting tuples for var=val (and for each variable/value pair). Check if any of the still input variable's current domains.
- Store one supporting tuple for var=val, if that one has been lost, use a method like (1) to find a new one.
- 4. A range of clever implementation methods have been developed

Complexity grows exponentially with constraint's arity. (We have to check all possible combination of assignments to the other variables).

## **Enforce GAC (prune all GAC inconsistent values)**

```
GacEnforce(cnstrs, assignedvar, assignedval):
  #cnstrs is a collection of constraints not known GAC.
  #Establish GAC on them and on all affected constraints
 while not cnstrs.empty():
    cnstr = cnstrs.extract()
                                  #make cnstr GAC
    for var in Assignmonte Project Exam Help
      for val in var.curDomain():
        if not cnsthttps://poweodercom):
          var.pruneValue(val,assignedvar,assignedval)
          if var.cuadha Vestat powcoder
            return "DWO" #domain wipe out
          for recheck in constraintsOf(var):
            if recheck != cnstr and not recheck in cnstrs:
              cnstrs.insert(recheck)
  return "OK"
```

## GAC Algorithm, enforce GAC during search

```
GAC(unAssignedVars): #search while maintaining GAC
 if unAssignedVars.empty():
   for var in variables:
     print var.name(), " = ", var.getValue()
   if all Solutions:
     return #continue search to print all solutions
   else: EXIT #terminate after one solution found
 var := unAssignedy Arssignent Projecte ExambHebpassign
  for val in var.curDomain():
                            #current domain!
   var.setValue(val)
                       https://powcoder.com
   noDWO = True
   if GacEnforce(constraintsOf(var),var, val) == "DWO":
     #only var's domain Added Workthatts powcode to be checked
     noDWO = False
   if noDWO:
       GAC(unAssignedVars)
   restoreValues(var, val)
                                #restore values pruned by var = val assignment
                                 #set var to be unassigned and return to list
 var.setValue(None)
 unAssignedVars.insert(var)
 return
```

#### **GAC-Initial call**

- Initially all variables are unassigned
- Initially unAssignedVars contains all variables
- Initially all constraints are GAC: this is accomplished by the call

GacEnforce (consignints nt) Pre, jeton Exam Help

- https://powcoder.com Remember the variable constraints is a list containing all constraints of the **WeChat powcoder**
- By passing the pruning "reason" as the "None" assignment, the values pruned at the root will not be in the variable's current domains during search.

## .hasSupport

- Finding a support for V=d in constraint C in the worst case requires O(2<sup>k</sup>) work, where k is the arity of C, i.e., |scope(C)|.
- So the method of examining alternate assignments to the other variables is limited to constraints of relatively small arity.

- A key development in practice is that for some constraints this https://powcoder.com. computation can be done time polynomial in the constraint's arity.
   Add WeChat powcoder
- An important example is the all-diff constraint. For, all-diff(V1, .... Vn) we can be check if Vi=d has a support in the current domains of the other variables in polynomial time using ideas from graph matching theory.
- The special purpose algorithms for achieving GAC on particular types of constraints are very important in practice.

## **GAC** enforce example

8	1	5	6					4	$GAC(C_{SS8}) \rightarrow CurDom of V_{1,5}, V_{1,6}, V_{2,4}, V_{3,4}, V_{$
6				7	5		8		
				9					
9				4	1	7			
	4						2		
		6	2	з /	SS	ign	me	nt	Project $Example Project Example Project Exam$
				5					
	5		9	1		ht	tps	/ <sub>6</sub> p	owcoder.com
1					7	8	9	5	Chat powcoder
	•	•							Cnat powcoder
				L		= ,	All-di	itt	

$$\begin{split} &C_{SS2} = \text{All-diff}(V_{1,4}, \, V_{1,5}, \, V_{1,6}, \, V_{2,4}, \, V_{2,5}, \, V_{2,6}, \, V_{3,4}, \, V_{3,5}, \, V_{3,6}) \\ &C_{R1} = \text{All-diff}(V_{1,1}, \, V_{1,2}, \, V_{1,3}, \, V_{1,4}, \, V_{1,5}, \, V_{1,6}, \, V_{1,7}, \, V_{1,8}, \, V_{1,9}) \\ &C_{C5} = \text{All-diff}(V_{1,5}, \, V_{2,5}, \, V_{35}, \, V_{4,5}, \, V_{5,5} \, V_{6,5}, \, V_{7,5}, \, V_{8,5}, \, V_{9,5}) \end{split}$$

By going back and forth between constraints we get more values pruned.
